[151 Quick Ideas to Recognize and Reward Employees \(16pt Large Print Edition\)](#) Jun 22 2020 Most managers understand the importance of giving their employees recognition and rewards, but when it comes to actually doing so, they often come up empty or use outdated, ineffective strategies. *151 Quick Ideas to Recognize and Reward Employees* will help managers stock up. Recognition and rewards are consistently found to be among the most powerful of all motivators for employees at any job level. In fact, when employees are asked to describe their most satisfying experiences at work, they frequently mention situations in which they received recognition and rewards for their performance. And, importantly, when managers are skilled in providing this type of feedback, their employees typically reward them with increased productivity, commitment and overall performance. However, just like customers who always order the same old entree at a restaurant, managers tend to choose the same old kinds of recognition and rewards. Some traditional rewards still work well, of course, but there is always room for new ideas. *151 Quick Ideas to Recognize and Reward Employees* offers you the full menu of recognition and reward strategies. It comes with detailed descriptions of the most popular ideas in business, plus others that are destined to become classics. Ideas such as: Enriching

jobs by giving employees more autonomy and decision-making responsibilities. Purchasing personally signed books suited to the potential you see in each employee. Awarding special coupons for free gasoline or transportation. Hiring a masseuse to rub out stiff necks and backs. Making your employees more invested by offering profit-sharing. Plus many free or low-cost rewards Included with each of the 151 strategies is an "assignment" that you can use as a roadmap to bring the idea to life. *The Evolution Delusion* Feb 28 2021 Does the field of evolution differ from other sciences? The author, a reviewer for a major medical journal, scrutinized hundreds of scientific references in evolutionary literature, adopting the same standards used for studies submitted for medical publication. The data show that there are two types of evolution, microevolution and macroevolution, with a clear boundary between them based upon the presence and absence of empirical evidence, respectively. The surprising results show that there is a universal disconnect between the data and the conclusions that claim to show the larger changes of macroevolution. The author reveals patterns of deviations from standard scientific methods in these studies. For the first time, evolutionary data have been summarized to describe both what evolution can and cannot accomplish. The author shows the reader how to recognize the different ways in which the evidence for microevolution within and between some species differs from the unsupported macroevolution of most species. Previous critiques of macroevolution have been debunked by advocates who have cited a multitude of scientific studies. This book goes beyond previous critiques by directly addressing the data from these studies to see if they do, in fact, support macroevolution-focused conclusions. Many expert counterarguments against this book's thesis are presented and examined in the context of scientific research to reassure the reader that the author has left no stone unturned in the macroevolution debate. A theory is proposed as to why there may be no empirical evidence for macroevolution. The book concludes with a section entitled "What we see differently." There, the author shows the reader the differences in perspective between the evolutionist and macroevolution critic as they look at and interpret the very same set of data.

Caught in the Net Jun 03 2021 "I don't even help [my children] with their homework in the evening because I'm in the chat rooms, and I don't help put them to bed because I don't realize how late it is. I also don't help them get ready for school in the morning like I used to do because I'm checking my e-mail. And I just can't stop myself."-Raymond, an Internet addict. Internet addiction is real. Like alcoholism, drug addiction, or compulsive gambling, it has devastating effects on the lives of addicts and their families: divorce, job loss, falling productivity at work, failure in school, and, in extreme cases, criminal behavior. The problem has already reached epidemic proportions in the United States, and the number of "netaholics" continues to grow rapidly as more households and businesses go on-line. Yet, until now, no one from the mental health community has come forward with a specific description of Internet addiction and its effects or a strategy for treatment and recovery. In *Caught in the Net*, Kimberly Young shares the results of her three-year study of Internet abuse. Often using

the words of the Internet addicts themselves, she presents the stories of dozens of lives that were shattered by an overwhelming compulsion to surf the Net, play MUD games, or chat with distant and invisible neighbors in the timeless limbo of cyberspace. Why is the Internet so seductive? What are the warning signs of Internet addiction? Is recovery possible? Dr. Young answers these questions and many more. She provides a questionnaire to help Net users determine whether they are addicts, and offers concrete steps to help problem users regulate Internet usage and devise a more balanced place for it in their daily lives. For Internet addicts as well as their parents, spouses, friends, and employers, *Caught in the Net* offers guidance on where and how to seek help from counselors, therapists, and other professionals who take this affliction seriously. For mental health professionals, this book provides insights into the nature and causes of Internet addiction and encourages counselors and therapists to expand their addiction recovery programs to address the specific problems of Internet addicts.

"Think that computer addiction is a joke? Think again. This groundbreaking book is the first to explore on-line addiction in a serious way and to consider the effects on individuals and their families. *Caught in the Net* is an important book for anyone who spends mornings and evenings connected to the Net."-Clifford Stoll, author of *The Cuckoo's Egg* and *Silicon Snake Oil*. "An excellent account of the dangers of the burgeoning Internet industry. Dr. Young carefully outlines the traps into which people can fall and offers pragmatic self-help suggestions. *Caught in the Net* is valuable for both consumers and the professionals who deal with them."-Maressa Hecht Orzack, PhD, Founder and Coordinator, Computer Addiction Services, McLean Hospital Lecturer, Harvard University Medical School "I don't mean to spend all my time this way, but I can't stop. It's the only place my opinion matters and I feel important."

It's the most powerful information tool I have ever known. When I explore the on-line world, I feel like that robot in the movie *Short Circuit*. I need more input! More input!"-daveage28.militarytelecommunicationexpert.internet.addict "I feel the rush every time my mind gets connected to this intensely powerful information whirlpool. *Understanding Social Signals: How Do We Recognize the Intentions of Others?* Aug 25 2020 Powerful and economic sensors such as high definition cameras and corresponding recognition software have become readily available, e.g. for face and motion recognition. However, designing user interfaces for robots, phones and computers that facilitate a seamless, intuitive, and apparently effortless communication as between humans is still highly challenging. This has shifted the focus from developing ever faster and higher resolution sensors to interpreting available sensor data for understanding social signals and recognising users' intentions. Psychologists, Ethnologists, Linguists and Sociologists have investigated social behaviour in human-human interaction. But their findings are rarely applied in the human-robot interaction domain. Instead, robot designers tend to rely on either proof-of-concept or machine learning based methods. In proving the concept, developers effectively demonstrate that users are able to adapt to robots deployed in the public space. Typically, an initial period of collecting human-robot interaction data is used for identifying frequently occurring problems. These are then addressed by adjusting the interaction policies on the basis of the collected data. However, the updated policies are strongly biased by the initial design of the robot and might not reflect natural,

spontaneous user behaviour. In the machine learning approach, learning algorithms are used for finding a mapping between the sensor data space and a hypothesised or estimated set of intentions. However, this brute-force approach ignores the possibility that some signals or modalities are superfluous or even disruptive in intention recognition. Furthermore, this method is very sensitive to peculiarities of the training data. In sum, both methods cannot reliably support natural interaction as they crucially depend on an accurate model of human intention recognition. Therefore, approaches to social robotics from engineers and computer scientists urgently have to be informed by studies of intention recognition in natural human-human communication. Combining the investigation of natural human behaviour and the design of computer and robot interfaces can significantly improve the usability of modern technology. For example, robots will be easier to use by a broad public if they can interpret the social signals that users spontaneously produce for conveying their intentions anyway. By correctly identifying and even anticipating the user's intention, the user will perceive that the system truly understands her/his needs. Vice versa, if a robot produces socially appropriate signals, it will be easier for its users to understand the robot's intentions. Furthermore, studying natural behaviour as a basis for controlling robots and other devices results in greater robustness, responsiveness and approachability. Thus, we welcome submissions that (a) investigate how relevant social signals can be identified in human behaviour, (b) investigate the meaning of social signals in a specific context or task, (c) identify the minimal set of intentions for describing a context or task, (d) demonstrate how insights from the analysis of social behaviour can improve a robot's capabilities, or (e) demonstrate how a robot can make itself more understandable to the user by producing more human-like social signals.

Introduction to Symbolic Plan and Goal Recognition Oct 15 2019 This is a high-level introduction and overview of plan and goal recognition including the core elements and practical advice for modeling them. Along with activity recognition, these areas of research play a crucial role in a wide variety of applications including assistive technology, software assistants, computer and network security, human-robot collaboration, natural language processing, video games, and much more. This synergistic area of research combines, unites, and makes use of techniques and research from a wide range of areas including user modeling, machine vision, automated planning, intelligent user interfaces, human-computer interaction, autonomous and multi-agent systems, natural language understanding, and machine learning. This wide range of applications and disciplines has produced a wealth of ideas, models, tools, and results in the recognition literature. However, it has also contributed to fragmentation in the field, with researchers publishing relevant results in a wide spectrum of journals and conferences. This book seeks to address this fragmentation by providing a high-level introduction and historical overview of the plan and goal recognition literature. It provides a description of the core elements that comprise these recognition problems and practical advice for modeling them. In particular, we

define and distinguish the different recognition tasks. We formalize the major approaches to modeling these problems using a single motivating example. Finally, we describe a number of state-of-the-art systems and their extensions, future challenges, and some potential applications.
