This useful book is designed to teach natural resources professionals how to be more effective in solving conservation and environmental policy problems. Its presentation of basic concepts, case studies, and "real world concerns" provides a deeper understanding of the policy process and makes the book an invaluable aid for students and practitioners in such fields as wildlife biology, conservation biology, forestry, range management, ecosystem management, and sustainable development. Susan G. Clark begins by describing the challenges faced by natural resources professionals. She then explains how the substance and process of policy analysis and decision making can be improved by using a policy sciences framework that takes into account biological, social, political, and institutional considerations. Finally she reflects on how issues of human rights and morality should affect natural resources management and policy analysis. The book is very user-friendly. A comprehensive analysis of natural resource use and economic development in poor countries, first published in 2005. Environmental issues are of fundamental importance, and a broad approach to understanding the relationship of the human economy and the natural world is essential. In a rapidly changing policy and scientific context, this new edition of Environmental and Natural Resource Economics reflects an updated perspective on modern environmental topics. Now in its fourth edition, this book includes new material on climate change, the cost-competitiveness

of renewable energy, global environmental trends, and sustainable economies. The text provides a balanced treatment of both standard environmental economics and ecological economics, based on the belief that these two approaches are complementary. Several chapters focus on the core concepts of environmental economics, including the theory of externalities, the management of public goods, the allocation of resources across time, environmental valuation, and cost-benefit analysis. Material on ecological economics includes such topics as macroeconomic scale, entropy, and "green" national accounting. Topical chapters focus on: energy; climate change; water resources; international trade; forests; fisheries; and agriculture, with an emphasis on designing effective policies to promote sustainability and a "green" economy. Harris and Roach's premise is that a pluralistic approach is essential to understand the complex nexus between the economy and the environment. This perspective, combined with its emphasis on real-world policies, is particularly appealing to both instructors and students. This is the ideal text for classes on environmental, natural resource, and ecological economics. The book's companion website is available at: <http://www.bu.edu/eci/education-materials/textbooks/environmental-and-natural-resource-economics/> Contributed articles. 'This book makes a significant contribution to the literature on natural resource law and governance by engaging specifically with the issues arising in the African region. It covers a wide spectrum of issues that are key to the sustainable use of natural resources in the region, thus making it an important resource for anyone interested in natural resource governance and economic development in the African region.' - Philippe Cullet, University of London, UK This well-researched book covers a wide spectrum of important issues that are central to investment in natural resources and ultimately, economic development of Africa. Francis Botchway and the expert contributors analyse the relationships between good governance and resource management, as well as the existing commercial and financial agreements. The environmental implication of resource exploitation and the international dimensions of the industry are also explored in this insightful study. Each comprehensive and concise contribution highlights the importance of transparency and equity in investment and management of natural resources. Natural Resource Investment and Africa's Development is essential material for scholars and students of development, environmental law, international economic law and dispute resolution, as well as any international investor in natural resources. This book integrates spatial analysis into the study and management of conflicts, and offers a model in conflict studies that incorporates theoretical explanations of conflict, its causes, and impacts, with a geospatial strategy for intervening in disputes over allocation and use of natural resources (connects theory and practice). Alongside a theoretical analysis of resource conflicts and an account of Participatory Mapping and PGIS development, this book provides a case study of GIS applications in conflict mediation. The book also lays out a practical and straightforward demonstration of PGIS applications in conflict management using a real-world case study, and traces the Participatory Mapping and PGIS movements' evolution, compares PPGIS and PGIS practices, and makes distinctions between traditional GIS applications and PGIS practice. The approach embodies the enhanced use of spatial information and media, sets of tools for analyzing, mapping, and displaying spatial data and a platform for participatory discussions that enhances consensus-building. The book, therefore, contributes to the search for novel approaches for managing current and emerging conflicts. With this book, resource managers, development practitioners, students, and scholars of Participatory Mapping and PGIS applications and conflict studies will be equipped with the principles, skills, and the tools they need to manage non-violent resource conflicts and keep the disputes from slipping into violence. The book will also be a valuable text for basic and advanced studies in Participatory Mapping and PGIS applications, Conflict Resolution and Conflict Management. Natural resources management has two principal dimensions :

Science-illuminated (earth, space, hydrological, pedological, information, etc. sciences) management of local resources (waters, soils, bioresources, minerals, rocks, sediments, etc.) in an ecologically-sustainable manner, and Value-addition through processing of natural products, through As demand for natural resources increases due to the rise in world population and living standards, conflicts over their access and control are becoming more prevalent. This book critically assesses different approaches to and conceptualizations of resource fairness and justice and applies them to the analysis of resource conflicts. Approaches addressed include cosmopolitan liberalism, political economy and political ecology. These are applied at various scales (local, national, international) and to initiatives and instruments in public and private resource governance, such as corporate social responsibility instruments, certification schemes, international law and commodity markets. In doing so, the contributions contrast existing approaches to fairness and justice and extend them by taking into account the interplay between political scales, regions, resources, and power structures in "glocalized" resource politics. Various case studies are included concerning agriculture, agrofuels, land grabbing, water resources, mining and biodiversity. The volume adds to the academic and policy debate by bringing together a variety of disciplines and perspectives in order to advance both a research and policy agenda that puts notions of resource fairness and justice center-stage. Natural resources are anything from nature that people can use. From fossil fuels deep underground used for power to trees used for lumber, natural resources are precious and sometimes nonrenewable. Readers learn both how natural resources are accessed as well as the importance of conserving them in two ways: traditional chapter text on each topic and a colorful flowchart to help them add a layer of understanding to their reading. Including topics supportive of the Earth science curriculum, this book covers renewable energy, mineral mining, water, and much more, as well as full-color photographs which have a strong text correlation. In this book, first published in 1990, Judith Rees considers the spatial distribution of resource availability, development and consumption, and the distribution of resource-generated wealth and welfare. Showing that there are no simple answers, she analyses the complex interactions between economic forces, administrative structures and political institutions. This well-structured text is essential reading for upper-level students in geography, environmental planning, economics and resource management. Papers presented at the Natural Resources for the 21st Century conference on November 14-17, 1988. Focuses on the current condition of our natural resource base and identifies factors that lead to its current conditions. Includes: population and economic patterns, climate, cropland and soils, forests, rangelands, wetlands, water resources wildlife, fisheries, wilderness, new technologies, recycling and outlines of perspective and analyses. Natural Resource Management in South Asia deals with the problems in the management of natural resources in South Asia. It raises reasonable concerns and queries the manner in which developmental policies are implemented, without undermining the importance of the economic development process. The topics include energy, land, biodiversity, water and the atmosphere, challenges faced by people in Afghanistan. The book examines options to ensure food and water security in South Asia and an alternative policy framework for a sustainable environment. Decisions about the conservation and use of natural resources are made every day by individuals, communities, and nations. The latest edition of Field's acclaimed text highlights the incentives and trade-offs embedded in such decisions, providing a lucid introduction to natural resource issues using the analytical framework of economics. Employing a logical structure and easy-to-understand descriptions, Field covers fundamental economic principles and their general application to natural resource use. These principles are further developed in chapters devoted to specific resources. Moreover, this up-to-date volume addresses the challenge of achieving socially beneficial utilization rates in the twenty-first century amid continuing population growth, urbanization,

and global climate change. Topics new to the Third Edition include: • implications of climate change on resources • fracking • energy intensity and the energy efficiency gap • reducing fossil energy • forests and carbon • international water issues • globalization and trade in natural resources

Examining the law, regulation and governance of natural resources, this timely work addresses the conflicts and contradictions arising at the intersection between international economic law, sustainable development and other areas of international law, most notably human rights law and environmental law. Bringing together a collection of legal and policy expertise from a range of academic and practitioner perspectives, this book will appeal to scholars of law, political science, international relations, political economy and development studies.

In *Contested Country*, leading researchers in planning, geography, environmental studies and public policy critically review Australia's environmental management under the auspices of the Natural Heritage Trust over the past decade, and identify the challenges that must be met in the national quest for sustainability. It is the first comprehensive, critical examination of the local and regional natural resources management undertaken in Australia, using research sourced from all states as well as the Northern Territory. It addresses questions such as: How is accountability to be maintained? Who is included and who is excluded in decentralised environmental governance? Does the scale of bottom-up management efforts match the scale of environmental problems? How is scientific and technical fidelity in environmental management to be maintained when significant activities are devolved to and controlled by local communities? The book challenges some of the accepted benefits, assumptions and ideologies underpinning regional scaled environmental management, and is a must-read for anyone interested in this field. This book explores the changes that are leading to a new century of natural resources management. It places the current situation in historical perspective, analyzes the forces that are propelling change, and describes and examines the specific changes in goals, policy, and practice that are transforming all aspects of natural resources management. The book is an important overview for wildlife biologists, foresters, and others working for public land agencies; professors and students of natural resources; and all those whose livelihood depends on the use of public natural resources. The textile industry is focused in its search for alternative green fibres with the aim of providing high-quality products which are fully recyclable and biodegradable. Natural textile materials from renewable sources play an increasingly important role in the industry due to their unique properties and functionality over synthetic fibres, as well as their sustainability. *Antimicrobial Textiles from Natural Resources* is an in-depth guide to the latest methods and applications of natural antimicrobial materials. A broad range of applications are addressed, from common to specialized applications, including many in the biomedical sector. This world-class collection of contributors write from a range of disciplinary backgrounds, providing important insights from textile science and technology, materials science, chemical engineering, and biomedical engineering. Advice and proposed solutions are presented in a rigorous and practical way, drawing on results and case studies obtained from academic and industrial laboratories worldwide. Examines how natural fibres can be used in the place of less renewable or sustainable choices, thus helping designers improve the sustainability of their products Provides unique coverage of the biofunctionality of biopolymers in textiles Explains how antimicrobial properties can reduce odour, extend the life of textiles, and provide numerous medical benefits
