Hadrons and Their Interactions: Current and Field Algebra, Soft Pions, Supermultiplets, and Related Topics focuses on formulas, principles, and interactions involved in the study of physics. The compilation contains the papers presented at the "Ettore Majorana," held in Erice on July 1-14, 1967. Divided into three parts with 22 chapters, the compilation focuses first on lectures on soft pions; the method of phenomenological lagrangians and algebra of fields; and radiative corrections to beta decay and the structure of hadrons. The second part focuses on seminars. The areas covered include a review of coherent production in strong interactions; spontaneous breakdown and the weak interaction angle; and the symmetries of

the S-matrix. The concluding part also focuses on lectures, including lectures on the present status of the fundamental interactions; a pedagogical exercise in binning and resolution; and the pomeranchuk affair and twisting trajectories. The compilation is a valuable source of data for readers and physicists wanting to explore the interactions of hadrons. In these classic lectures, Feynman analyses the theoretical questions related to electron and photon interactions at high energies. These lectures are based on a special topics course taught by Feynman at Caltech in 1971 and 1972. The material is dealt with on an advanced level and includes discussions of vector meson dominance and deep inelastic scattering. The possible consequences of the parton model are also analyzed. Analyzes the theoretical questions related to electron and photon interactions at high energies. The topics treated in this volume are intermediate and high-energy nuclear physics with real and virtual photons and the interplay between nuclear and particle physics. The first part, devoted to vector mesons, is also intended to explore the scientific perspectives of a new generation of electron accelerators. The second part is devoted to physics currently under study at intermediate-

energy real-photon facilities with some emphasis on the Compton effect and its relation to quark models. A English translation of wide-ranging lectures on high-energy elementary particle physics given by one of the twentieth century's leading physicists. Intended for graduate students, advanced undergraduates and research staff in particle physics and related disciplines and will also be of interest to physicists not working in this field who want an overview of the present development of the subject. The topics treated in this volume are intermediate and high-energy nuclear physics with real and virtual photons and the interplay between nuclear and particle physics. The first part, devoted to vector mesons, is also intended to explore the scientific perspectives of a new generation of electron accelerators. The second part is devoted to physics currently under study at intermediate-energy real-photon facilities with some emphasis on the Compton effect and its relation to quark models. The distribution of quarks within protons and neutrons, their interactions, and how they define the properties of protons, neutrons and nuclei, are subjects of major research worldwide. Written by leading experts in the field, both theoretical and experimental, this book provides

an authoritative overview on the subject. The emphasis throughout the book is on phenomenology, and the book concentrates on describing the main features of the experimental data and the theoretical ideas used in their interpretation. Sections on chiral perturbation theory, crucial in understanding soft pions and soft photons near threshold, and duality ideas, equally crucial at intermediate energies, are included. This is an essential reference for graduate students and researchers in the field of particle physics and electromagnetic interactions. In this thesis we calculate the interaction potentials between two hadrons that are pinned in place on the lattice by infinitely heavy quarks. The potentials are calculated to leading order in the strong coupling and hopping parameter expansions for the following six systems: meson/meson, baryon/antimeson, baryon/baryon, meson/antimeson, baryon/meson and baryon/antibaryon. For each hadron/hadron system, we consider all allowed spin and isospin configurations for the light quarks. The interaction potentials we find take the form of one-meson-exchange potentials, whose sign and magnitude depends on the light quarks' spin and isospin. Graduate lecture notes by Vladimir

Gribov, one of the founding fathers of high-energy elementary particle physics, now reissued as OA.
